24 April 2026

Jumbled jobs picture

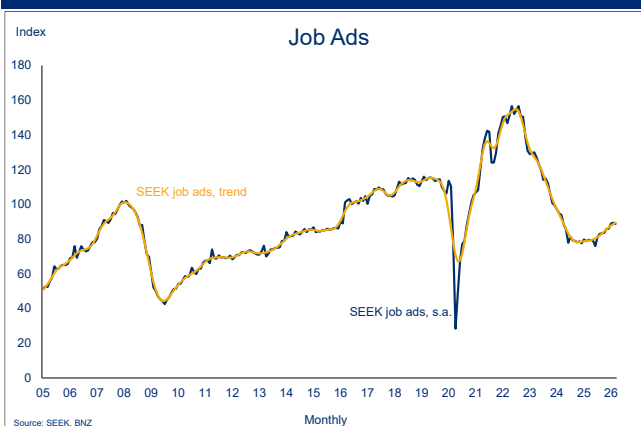

- **March jobs ads soften slightly**
- **Unclear if related to the Middle East conflict**
- **Hiring intentions falling**
- **But advertised wages lifting**

	Mar-24	Mar-25	Jan-26	Feb-26	Mar-26
m/m % change	-2.8	0.2	1.2	1.0	0.8
m/m % change (s.a.)	-1.1	1.0	3.4	0.5	-0.7
3m/3m	-8.5	0.7	4.2	4.0	3.5
Ann % change (m/m)	-28.0	-13.7	11.6	12.4	13.0
Ann % change (3m/3m)	-27.1	-16.3	10.5	11.5	12.3

All data is the trend unless otherwise indicated

In March, SEEK job ads eased 0.7% m/m in seasonally adjusted terms. While changes in economic indicators are quickly being attributed to the Middle East conflict, we are cautious to jump to any strong conclusions here. It is possible the fall in ads has been brought about by the war and rise in uncertainty, leading some firms to put hiring plans on hold. It is also possible that it is too early to see these impacts, and March is just typical monthly variation. The trend in ads is still moving higher, lifting 3.5% in Q1.

Off a low base

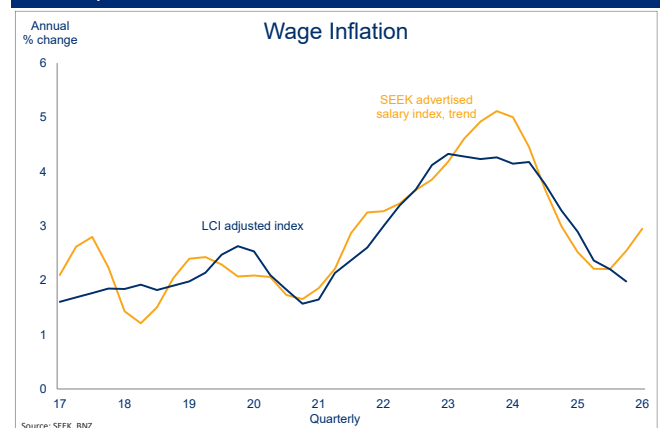

The March Quarterly Survey of Business Opinion (QSBO) didn't provide much more clarity either. It showed a significant drop in firms' employment intentions. The level is still consistent with our forecasts for some employment growth this year. However, we are wary, as the responses likely deteriorated as the month wore on.

Well, what can we say with certainty? We know that annual inflation is lifting sharply, growth is softening, and the labour market is likely to lag. Official labour market data for the March 2026 quarter is due on Wednesday 6 May. These will be of interest, but only to the extent they provide insight into the state of the job market largely pre-conflict. We forecast the unemployment rate to stay at 5.4% and hold around this level for an extended period.

We will also be monitoring annual wage growth, as a guide to medium-term inflation. The adjusted Labour Cost Index (LCI) was 2.0% last quarter and is likely to remain subdued. Annual growth in the SEEK advertised salary index lifted surprisingly to 3.0% in February and suggests some upside risk to our wage forecasts, albeit the data are pre-war and there is not a one-for-one match.

Some upside risk

We will be watching wage indicators more closely than normal, given RBNZ Governor Breman has said wage growth, core inflation and inflation expectations could be triggers for lifting the OCR sooner than they might otherwise. In annual terms, the majority of core inflation measures eased a touch in Q1. It is still too early to see sharp fuel price increases drive up other prices more broadly. The RBNZ Survey of Expectations is due 13 May, and will no doubt show further increases in short-term inflation expectations. We will be more interested in the survey's medium and long-term inflation expectations.

SEEK Disclaimer: Data is provided by SEEK and includes the SEEK Employment Index (SEI). All data is trend unless otherwise stated. The Data should be viewed and regarded as standalone information and should not be aggregated with any other information. The Data is provided in summary form and while care has been taken in its preparation, SEEK makes no representations whatsoever as to its completeness or accuracy. SEEK expressly bears no responsibility or liability for reliance placed by you on the Data or from the use of the Data by you. The SEI measures only new job ads posted within the reported month to provide a clean measure of demand for labour across all classifications. The SEI may differ to the job ad count on SEEK's website due to a number of factors including: 1) seasonal adjustments applied to the SEI; 2) the exclusion of duplicated job ads from the SEI.

The Covid-19 pandemic led to a high level of volatility in labour market data between April 2020 and March 2022. As a result, caution is recommended when interpreting trend estimates during this period as large month-to-month changes in variables generated multiple trend breaks.

The applications per ad index contains a series break at Jan 2016 when the calculation of this series changed from using gross variables (inclusive of all SEEK job listings) to net variables (removing duplicate job listings). This change has a negligible impact on recent data points, but caution is recommended when interpreting data immediately following the series break, and particularly in 2016 where growth rates have not been adjusted for the series break.
